

I am very new to the Amateur Radio Service and at present hold a Technician class license.. However, I wish to persuade the FCC from allowing BPL to be implemented. I have heard the interference caused by BPL and believe this will lead to the destruction or at the least, deterioration of the HF bands used by the Amateur Radio Service.

Presently, we are approaching the minimum sunspot cycle. However, when at the sunspot peak and conditions favor low power (QRP) worldwide communications, I am of the opinion what I heard from "down the street" BPL interference will be heard worldwide.

There are many technologies that make BPL unnecessary. BPL will never be able to carry the high bandwidth demands for mass distribution of video much less the up-and-coming HDTV.

Thank You!
